MODULE 2

FIRST LAW OF THERMODYNAMICS FOR A CLOSED SYSTEM UNDERGOING A CYCLE

- The first law of thermodynamics states that, for a closed system undergoing a cycle, the cyclic integral of the heat is proportional to the cyclic integral of work.

$$
\phi \mathrm{dQ} \alpha \phi \mathrm{dw}
$$

- The transfer of heat \& the performance of work may both cause the same effect in a system.
- Energy which enters a system as heat may leave the system as work, or energy which enters the system as work may leave as heat.
- Consider the gas in a container as shown. Let this system go through a cycle that is made up of two processes.
- In the first process work is done on the system by the paddle that turns as the weight is lowered. Let the system then return to its initial state by transferring heat from the system until the cycle has been completed.

- When the amounts of work \& heat are compared, it is found that they are always proportional. This is known as the first law of thermodynamics, which is in the equation form, is:
- $\mathrm{J} \phi \mathrm{dQ}=\phi \mathrm{dw}$

## FIRST LAW FOR A CLOSED SYSTEM UNDERGOING A CHANGE OF STATE

- The first law of thermodynamic for a closed system undergoing a change of state states that the net energy transfer will be stored or accumulated within the system. If Q is the amount of heat transferred to the system \& W is the amount of work transferred from the system during the process, the net energy transfer.
- $(\mathrm{Q}-\mathrm{W})$ will be stored in the system. Energy storage is neither heat nor work.
- ie. $\mathrm{Q}-\mathrm{W}=\Delta \mathrm{E}$

Where $\mathrm{Q}, \mathrm{W} \& \Delta \mathrm{E}$ are expressed in Joules.

Surroundings

- If there are more energy transfer quantities involved in the process as shown; The first law gives:
- $\left(\mathrm{Q}_{2}+\mathrm{Q}_{3}-\mathrm{Q}_{1}\right)=\Delta \mathrm{E}+\left(\mathrm{W}_{2}+\mathrm{W}_{3}-\mathrm{W}_{1}-\mathrm{W}_{4}\right)$

Energy is thus conserved in the operation.

- eg. 1.Consider a process that involves heat transfer but no work transfer as in the case of baking a potato. That is if 5 kJ of heat is transferred to the potato the energy increase of the potato will also be 5 kJ .
- Consider a process that involves work transfer but no heat transfer as in the case of an electric heater in an adiabatic room. The electrical WD on the system is equal to the increase in energy of the system.
- Consider a system that involve both heat \& work interaction. If a system gains 12 kJ of heat during a process while 6 kJ of work is done on it the increase in energy of the system during that process is 18 kJ .

$$
Q_{\mathrm{in}}=5 \mathrm{~kJ}
$$

The increase in the energy of a potato in an oven is equal to the amount of heat transferred to it.

The energy change of a system during a process is equal to the net work and heat transfer between the system and its surroundings.

$$
Q_{\mathrm{in}}=15 \mathrm{~kJ}
$$

In the absence of any work interactions, the energy change of a (Adiabatic)

(Adiabatic)

The work (electrical) done on an adiabatic system is equal to the increase in the energy of the system.

The work (shaft) done on an adiabatic system is equal to the increase in the energy of the system.

## CONCEPT OF ENERGY

- Consider a system which changes its state from. State 1 to state 2 by following the path A, \& returns from state 2 to state 1 by following the path $\mathrm{B} \& \mathrm{C}$. So the system undergoes a cycle.

Applying first law for path A \& B separately,

$$
\begin{align*}
& \mathrm{Q}_{\mathrm{A}}=\Delta \mathrm{E}_{\mathrm{A}}+\mathrm{W}_{\mathrm{A}} .  \tag{1}\\
& \mathrm{Q}_{\mathrm{B}}=\Delta \mathrm{E}_{\mathrm{B}}+\mathrm{W}_{\mathrm{B}} . \tag{2}
\end{align*}
$$

- The process A \& B together constitutes a cycle, then;
- $\phi \mathrm{dQ}=\phi \mathrm{d} w$
- $\mathrm{Q}_{\mathrm{A}}+\mathrm{Q}_{\mathrm{B}}=\mathrm{W}_{\mathrm{A}}+\mathrm{W}_{\mathrm{B}}$
- ie, $\mathrm{Q}_{\mathrm{A}}-\mathrm{W}_{\mathrm{B}}=\mathrm{W}_{\mathrm{B}}-\mathrm{Q}_{\mathrm{B}}$
- From (1) \& (2) $=>$ ie $\Delta \mathrm{E}_{\mathrm{A}}=-\Delta \mathrm{E}_{\mathrm{B}}$
- Similarly considering the process A \& C constituting a cycle we get.
- $\Delta \mathrm{E}_{\mathrm{A}}=-\Delta \mathrm{E}_{\mathrm{C}}$.
- From (3) \& (4), we get
- $\Delta \mathrm{E}_{\mathrm{B}}=-\Delta \mathrm{E}_{\mathrm{C}}=\Delta \mathrm{E}_{\mathrm{A}}$
- Therefore, it is seen that the change in energy between two states of a system is the same, whatever path the system may follow in undergoing that change of state.
- If some arbitrary value of energy is assigned to state 2 , the value of energy at state 1 is fixed independent of the path the system follow.
- Therefore, energy has a definite value for every state of the system. Hence it is a point function $\&$ thus a property of the system.

## ENTHALPY

Consider a system undergoing a quasi-equilibrium constant pressure process. Applying first law ${ }_{1} \mathrm{Q}_{2}=\mathrm{U} 2-\mathrm{U}_{1}+{ }_{1} \mathrm{~W}_{2}$

The work can be calculated from ${ }_{1} \mathrm{~W}_{2}=2 \int_{1} \mathrm{PdV}$
Since pressure is constant,

$$
\begin{aligned}
& { }_{1} \mathrm{~W}_{2}=2 \int_{1} \mathrm{dV}=\mathrm{P}\left(\mathrm{~V}_{2}-\mathrm{V}_{1}\right) \\
& \therefore{ }_{1} \mathrm{Q}_{2}=\mathrm{U}_{2}-\mathrm{U}_{1}+\mathrm{P}_{2} \mathrm{~V}_{2}-\mathrm{P}_{1} \mathrm{~V}_{1} \\
& \text { ie, }{ }_{1} \mathrm{Q}_{2}=\left(\mathrm{U} 2+\mathrm{P}_{2} \mathrm{~V}_{2}\right)-\left(\mathrm{U}_{1}+\mathrm{P}_{1} \mathrm{~V}_{1}\right)
\end{aligned}
$$

ie, heat transfer for constant pressure is can be shown as the change in quantity $U+P V$ between initial \& find states.

Since U, P \& V are thermodynamic properties; their combination of $(\mathrm{U}+\mathrm{PV})$ has the same characteristic. ie $(\mathrm{U}+\mathrm{PV})$ is also a thermodynamic property \& is termed as enthalpy.

## SPECIFIC HEATS

1) SPECIFIC HEAT AT CONSTANT VOLUME ( $\mathrm{C}_{\mathrm{V}}$ )

- It is the amount of heat added or removed per degree change in temperature when the system is kept at constant volume. It is denoted as $\mathrm{C}_{\mathrm{V}}$.

$$
\mathrm{ieCv}=\left(\frac{\partial \mathrm{Q}}{\partial \mathrm{~T}}\right)_{\mathrm{V}}
$$

- By first law, ${ }_{1} \mathrm{Q}_{2}-{ }_{1} \mathrm{~W}_{2}=\Delta \mathrm{U}$
- For constant volume process, $\mathrm{dV}=0$
- $\therefore \mathrm{WD}=\mathrm{PdV}=0$
- ie, ${ }_{1} \mathrm{Q}_{2}=\Delta \mathrm{U}$

$$
\mathrm{ie} \mathrm{Cv}=\left(\frac{\partial \mathrm{U}}{\partial \mathrm{~T}}\right)_{V}
$$

- Or, $\Delta \mathrm{U}=\mathrm{mC}_{\mathrm{V}} \Delta \mathrm{T}$

## 2) SPECIFIC HEAT AT CONSTANT PRESSURE (Cp)

- It is the amount of heat added or removed per degree change in temperature when the system is kept under constant pressure. It is denoted by Cp .

$$
\text { ie } \mathrm{Cp}=\left(\frac{\partial \mathrm{Q}}{\partial T}\right)_{\mathrm{p}}
$$

- For a constant pressure process; ${ }_{1} \mathrm{Q}_{2}=\Delta \mathrm{H}$

$$
\mathrm{Cp}=\left(\frac{\partial \mathrm{H}}{\partial \mathrm{~T}}\right)_{\mathrm{p}}
$$

## RELATIONSHIP FOR Cp, Cv, R

Enthalpy, $\mathrm{H}=\mathrm{U}+\mathrm{PV}$

For an ideal gas, $\mathrm{PV}=\mathrm{mRT}$

$$
\begin{aligned}
& \therefore \mathrm{H}=\mathrm{U}+\mathrm{mRT} \\
& \therefore \Delta \mathrm{H} \quad=\Delta \mathrm{U}+\mathrm{mR} \Delta \mathrm{~T} \quad \ldots \ldots \ldots \ldots .(1) \\
& \text { But } \Delta \mathrm{H}=\mathrm{mCp} \Delta \mathrm{~T} \text { and } \Delta \mathrm{U}=\mathrm{mC}_{\mathrm{V}} \Delta \mathrm{~T}
\end{aligned}
$$

Substituting in (1) we get,
$\mathrm{mCp} \Delta \mathrm{T}=\mathrm{mC}_{\mathrm{V}} \Delta \mathrm{T}+\mathrm{mR} \Delta \mathrm{T}$
ie, $\mathrm{Cp}=\mathrm{Cv}+\mathrm{R}$
$\mathrm{Cp}-\mathrm{Cv}=\mathrm{R}$

Dividing by $\mathrm{C}_{\mathrm{V}}$,
$\left\{\mathrm{Cp} / \mathrm{C}_{\mathrm{V}}\right\}-1=\mathrm{R} / \mathrm{C}_{\mathrm{V}}$
$\mathrm{Cp} / \mathrm{C}_{\mathrm{V}}=\gamma$
$\therefore \gamma-1=\mathrm{R} / \mathrm{C}_{\mathrm{V}}$
$\therefore \mathrm{C}_{\mathrm{V}}=\mathrm{R} /(\gamma-1)$
Substituting for $\mathrm{C}_{\mathrm{V}}$ in equation (2),

$$
\begin{aligned}
& \mathrm{Cp}-\frac{\mathrm{R}}{\gamma-1}=\mathrm{R} \\
& \mathrm{Cp}=\mathrm{R}+\frac{\mathrm{R}}{\gamma-1} \\
& \mathrm{Cp}=\frac{(\gamma-1) \mathrm{R}+\mathrm{R}}{\gamma-1}=\frac{\mathrm{R}(\gamma-1+1)}{\gamma-1}
\end{aligned}
$$

$$
\mathrm{ie}, \mathrm{Cp}=\frac{\mathrm{R} \gamma}{\gamma-1}
$$

- Q. In an internal combustine engine, during the compression stroke the heat rejected to the cooling water is $50 \mathrm{~kJ} / \mathrm{kg}$ and the work input is $100 \mathrm{~kJ} / \mathrm{kg}$. Calculate the change in internal energy of the working fluid stating whether it is a gain or loss.
- Ans. $\mathrm{Q}=-50 \mathrm{~kJ} / \mathrm{kg}, \mathrm{W}=-100 \mathrm{~kJ} / \mathrm{kg}, \Delta \mathrm{u}=$ ?

$$
\begin{aligned}
& \mathrm{Q}=\Delta \mathrm{u}+\mathrm{W} \\
& -50=\Delta \mathrm{u}-100 \\
& \Delta \mathrm{U}=-50+100=50 \mathrm{~kJ} / \mathrm{kg}
\end{aligned}
$$

- Q. In an air motor cylinder the compressed air has an internal energy of $450 \mathrm{~kJ} / \mathrm{kg}$ at the beginning of the expansion and an internal energy of $220 \mathrm{~kJ} / \mathrm{kg}$ after expansion. If the work done by the air during the expansion is $120 \mathrm{~kJ} / \mathrm{kg}$, calculate the heat flow to and from the cylinder.
- Ans.

$$
\begin{aligned}
& \mathrm{U} 1=450 \mathrm{~kJ} / \mathrm{kg}, \quad \mathrm{U} 2=220 \mathrm{~kJ} / \mathrm{kg}, \quad \mathrm{~W}=120 \mathrm{~kJ} / \mathrm{kg} \\
& \mathrm{Q}=(220-450)+120=-110 \mathrm{~kJ} / \mathrm{kg}
\end{aligned}
$$

ie, heat is rejected from the air.

- Q. 0.3 Kg of nitrogen gas at $100 \mathrm{kPa} \& 40^{\circ} \mathrm{C}$ is contained in a cylinder. The piston is moved compressing nitrogen until the pressure becomes $1 \mathrm{MPa} \&$ temperature becomes $160^{\circ} \mathrm{C}$. The work done during the process is 30 kJ . Calculate the heat transferred from nitrogen to the surroundings. $\mathrm{C}_{\mathrm{V}}$ for $\mathrm{N}_{2}=0.75 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$.
- Ans.

$$
\begin{aligned}
& \mathrm{m}=0.3 \mathrm{~kg}, \quad \mathrm{P}_{1}=100 \mathrm{kPa}, \quad \mathrm{P}_{2}=1 \mathrm{MPa}, \quad \mathrm{~T}_{1}=40^{\circ} \mathrm{C}=313 \mathrm{~K}, \quad \mathrm{~T}_{2}=600 \mathrm{C}=433 \mathrm{~K} \\
& \mathrm{~W}=-30 \mathrm{~kJ} \text { (compression), } \mathrm{Q}=?
\end{aligned}
$$

$$
\mathrm{Q}=\Delta \mathrm{U}+\mathrm{W}
$$

$$
\Delta \mathrm{U}=\Delta \mathrm{m} \mathrm{C}_{\mathrm{V}} \mathrm{~T}=0.3 \times 0.75(433-313)=27 \mathrm{~kJ}
$$

$$
\Delta \mathrm{Q}=\Delta \mathrm{U}+\mathrm{W}=27-30=-3 \mathrm{~kJ}
$$

ie, heat is rejected during the process.

- Q. When a stationary mass of gas was compressed without friction at constant pressure its initial state of $0.4 \mathrm{~m}^{3}$ and 0.105 MPa was found to change to final state of $0.20 \mathrm{~m}^{3}$ and 0.105 MPa . There was a transfer of 42.5 kJ of heat from the gas during the process. How much did the internal energy of the gas change?
- Ans.
$\mathrm{V}_{1}=0.4 \mathrm{~m}^{3}, \quad \mathrm{P}_{1}=0.105 \mathrm{MPa}, \quad \mathrm{V}_{2}=0.2 \mathrm{~m}^{3}, \quad \mathrm{P}_{2}=0.105 \mathrm{MPa}, \quad \mathrm{Q}=-42.5 \mathrm{~kJ}$ $\Delta \mathrm{U}=$ ?
- $\mathrm{Q}=\mathrm{W}+\Delta \mathrm{U}$
- $\mathrm{W}=\mathrm{PdV}$
- ie, $\mathrm{W}=0.105 \times 10^{3}(0.2-0.4)=-21 \mathrm{~kJ}$
- $\Delta \mathrm{U}=\mathrm{Q}-\mathrm{W}=-42.5-(-21)=-21.5 \mathrm{~kJ}$
- ie, there is a decrease in internal energy.

## Q. A cylinder containing the air comprises the system. Cycle is completed as follows:

i) $82,000 \mathrm{Nm}$ of work is done by the piston on the air during compression stroke \& 45 kJ of heat are rejected to the surroundings.
ii) During expansion stroke 100000 Nm of work is done by the air on the piston.

Calculate the quantity of heat added to the system

- Ans.
- Compression stroke
- Work done $=-82000 \mathrm{Nm}=-82 \mathrm{~kJ}$
- $\mathrm{Q}=-45 \mathrm{~kJ}$
- $\Delta \mathrm{U}=\mathrm{Q}-\mathrm{W}=-45-(-82)=37 \mathrm{~kJ}$
- Expansion stroke
- $\mathrm{W}=1000000 \mathrm{Nm}=100 \mathrm{~kJ}$
- $\Delta \mathrm{U}=-37 \mathrm{~kJ}$
- $\therefore \mathrm{Q}=\mathrm{U}+\mathrm{W}=-37+100=63 \mathrm{~kJ}$
- The total heat added to the system.
- Q. A rigid tank contains a hot fluid that is cooled while being stirred by a paddle wheel. Initially the internal energy of the fluid is 800 kJ . During the cooling process, the fluid loses 500 kJ of heat, \& the paddle wheel does 100 kJ of work on the fluid. Determine the final energy of the fluid.
- Ans.
- $\mathrm{U} 1=800 \mathrm{~kJ}, \mathrm{Q}=-500 \mathrm{~kJ}, \mathrm{~W}=-100 \mathrm{~kJ}$
- $\mathrm{U} 2=$ ?
- $\mathrm{Q}=\Delta \mathrm{U}+\mathrm{W}$
- $-500=(\mathrm{U} 2-800)+-100$
- $\mathrm{U} 2-800=-500-(-100)=-400$
- $\mathrm{U} 2=-400+800=400 \mathrm{~kJ}$
- Q. The properties of a certain fluid are related as follows. $u=196+0.718 t, P v=0.287(t+273)$, where $u$ is the specific internal energy $(\mathrm{kJ} / \mathrm{kg}), \mathrm{t}$ in ${ }^{0} \mathrm{C}$. P is pressure $\left(\mathrm{kN} / \mathrm{m}^{2}\right)$ and v is the specific volume in $\mathrm{m}^{3} / \mathrm{kg}$. Find $\mathrm{C}_{\mathrm{P}} \& \mathrm{C}_{\mathrm{V}}$ for the fluid.
- Ans.
- $u=196+0.718 t, \quad P v=0.287(t+273)$
- du/dt $=0.718$
- $\mathrm{du}=\mathrm{C}_{\mathrm{V}} \mathrm{dt}$
- Therefore, $\mathrm{C}_{\mathrm{V}}=\mathrm{du} / \mathrm{dt}=0.718 \mathrm{~kJ} / \mathrm{kg}$
- $\mathrm{h}=\mathrm{u}+\mathrm{Pv}$
- $\mathrm{u}=196+0.718 \mathrm{t}$
- $\mathrm{Pv}=78.351+0.287 \mathrm{t}$
- $(1)+(2), \mathrm{h}=274.351+1.005 \mathrm{t}$
- Therefore, $\mathrm{dh} / \mathrm{dt}=1.005$
- $\mathrm{dh}=\mathrm{Cp} \mathrm{dT}$
- Therefore, $\mathrm{C}_{\mathrm{P}}=\mathrm{dh} / \mathrm{dt}=1.005 \mathrm{~kJ} / \mathrm{kg}$
- Q. A fluid is contained in a cylinder with a piston so that the pressure in the fluid is a linear function of the volume $\mathrm{P}=\mathrm{a}+\mathrm{bv}$. The internal energy of the fluid is given by $\mathrm{U}=42+3.6 \mathrm{PV}$, where, U is the $\mathrm{kJ}, \mathrm{P}$ in $\mathrm{kPa}, \& \mathrm{~V}$ in $\mathrm{m}^{3}$. If the fluid changes from an initial state of 190 kPa , $0.035 \mathrm{~m}^{3}$ to a final state of $420 \mathrm{kPa}, 0.07 \mathrm{~m}^{3}$, with no work other than that done on the piston, find the direction \& magnitude of work \& heat transfer.

$$
\begin{align*}
& \mathrm{P}=\mathrm{a}+\mathrm{bv}, \quad \mathrm{P}_{1}=190 \mathrm{kPa}, \quad \mathrm{P}_{2}=420 \mathrm{kPa}, \quad \mathrm{~V}_{1=}=0.035 \mathrm{~m}^{3}, \quad \mathrm{~V}_{2}=0.07 \mathrm{~m}^{3} \\
& \mathrm{U}=42+3.6 \mathrm{PV} \\
& \mathrm{U}=\mathrm{U} 2-\mathrm{U}_{1}=\left(42+3.6 \mathrm{P}_{2} \mathrm{~V}_{2}\right)-\left(42+3.6 \mathrm{P}_{1} \mathrm{~V}_{1}\right) \\
& =36\left(\mathrm{P}_{2} \mathrm{~V}_{2}-\mathrm{P}_{1} \mathrm{~V}_{1}\right) \\
& =3.6 \times 10^{3}(4.2 \times 0.07-1.9 \times 0.035) \mathrm{kJ}=81.9 \mathrm{~kJ} \\
& P=a+b v \\
& 190=a+b x 0.035  \tag{1}\\
& 420=a+b \times 0.07  \tag{2}\\
& \text { (1) }-(2) \Rightarrow 230=0.035 \mathrm{~b}
\end{align*}
$$

Therefore, $\mathrm{b}=230 / 0.035=6571 \mathrm{kN} / \mathrm{m}^{5}$

$$
\mathrm{a}=-40 \mathrm{kN} / \mathrm{m}^{2}
$$

$$
\mathrm{W}=\int \mathrm{pdV}=\int(\mathrm{a}+\mathrm{bV}) \mathrm{dV}
$$

$$
\mathrm{W}=\mathrm{a}\left(\mathrm{~V}_{2}-\mathrm{V}_{1}\right)+\mathrm{b}\left\{\left(\mathrm{~V}_{2}^{2}-\mathrm{V}_{1}^{2}\right) / 2\right\}
$$

$$
\text { ie, } \mathrm{W}=\left(\mathrm{V}_{2}-\mathrm{V}_{1}\right)\left[\mathrm{a}+\mathrm{b} / 2\left(\mathrm{~V}_{1}+\mathrm{V}_{2}\right)\right]
$$

$$
\text { ie, } \mathrm{W}=(0.074-0.035)\left[-40 \mathrm{kN} / \mathrm{m}^{2}+6571 \mathrm{kN} / \mathrm{m}^{2}(0.035+0.07)\right]=10.67 \mathrm{~kJ}
$$

$$
\mathrm{Q}=\Delta \mathrm{U}+\mathrm{W}
$$

$$
\mathrm{ie}, \mathrm{Q}=81.9+10.67=92.57 \mathrm{~kJ}
$$

- Q. Gas from a bottle of compressed helium is used to inflate an inelastic flexible balloon, originally folded completely flat to a volume of $0.5 \mathrm{~m}^{3}$. If the barometer reads 760 mm kg , what is the amount of work done upon the atmosphere by the balloon?
Ans.
$\mathrm{V}_{1}$ of balloon $=0, \quad \mathrm{~V}_{2}$ of balloon $=0.5 \mathrm{~m}^{3}$
$\mathrm{P}=760 \mathrm{~mm}$ of $\mathrm{Hg}=1.01325 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}=101.325 \mathrm{kN} / \mathrm{m}^{2}$
- $\mathrm{W}_{\mathrm{d}}=\int \mathrm{pdv}+\int \mathrm{pdv}$
balloon bottie
$=\mathrm{P}\left(\mathrm{V}_{2}-\mathrm{V}_{1}\right)+(\mathrm{Px} 0)=101.325 \mathrm{kN} / \mathrm{m}^{2} \times 0.5 \mathrm{~m}^{3}=50.66 \mathrm{~kJ}$
Work is +ve as work is done by the balloon.
- Q. When the valve of an evacuated bottle is opened, atmospheric air rushes into it. If the atmospheric pressure is 101.325 kPa , and $0.6 \mathrm{~m}^{3}$ of air (measured at atmospheric condition) enter into the bottle. Calculate the work done by air.

$$
\mathrm{P}=101.325 \mathrm{kPa}, \quad \mathrm{~V}_{1} \text { of air in bottle }=0, \quad \mathrm{~V}_{2} \text { of air in bottle }=0.6 \mathrm{~m}^{2}
$$

$$
\begin{aligned}
& \mathrm{W}_{\mathrm{d}}=\int_{\text {Bottle }} \mathrm{pdv}+\int_{\text {Free air }} \mathrm{pdv} \\
& \mathrm{~W}_{\mathrm{d}}=0+101.325(0.6-0)=60.8 \mathrm{~kJ}
\end{aligned}
$$

- Since the free air boundary is contracting, the work done by the system is negative, ie, $W_{d}=-60.8 \mathrm{~kJ}$
- If the temperature and pressure becomes atmospheric after filling, determine the amount of heat transfer.

$$
\mathrm{W}=-60.8 \mathrm{~kJ}
$$

$\therefore$ Heat transfer, $\mathrm{Q}=60.8 \mathrm{~kJ}$

- Q. A piston and cylinder machine containing a fluid system has a stirring device in the cylinder. The piston is frictionless and it is held down against the fluid due to atmospheric pressure of 101.325 kPa . The stirring device is turned 10,000 revolutions with an average torque against the fluid of 1.275 MN . Meanwhile the piston of 0.6 m diameter moves out 0.8 m . Find the net work transfer for the system.

Ans.

$$
\mathrm{P}=101.325 \mathrm{kPa}, \quad \mathrm{~N}=10,000, \quad \mathrm{~d}=0.6 \mathrm{~m}, \quad \mathrm{~T}=1.275 \mathrm{MN}, \quad \mathrm{~L}=0.8 \mathrm{~m}
$$

Work done by the stirring device upon the system $=\mathrm{W}_{1}=2 \pi \mathrm{TN}$
$\mathrm{W}_{1}=2 \pi \times 1.275 \times 10^{3}, 000 \mathrm{Nm}=80 \mathrm{~kJ}$
$\mathrm{W}_{1}=-80 \mathrm{~kJ}$ as work done is on the system.
Work done by the piston on the surrounding, $=\mathrm{W}_{2}=(\mathrm{PA}) \mathrm{L}$
$\mathrm{W}_{2}=101.325 \mathrm{x} \pi / 40.6^{2} \times 0.8=2.9 \mathrm{~kJ}$
$\therefore \mathrm{W}=\mathrm{W}_{1}+\mathrm{W}_{2}=-80+22.9=-57.1 \mathrm{~kJ}$

- Q. A piston and cylinder machine contains a fluid system which passes through a complete cycle of 4 processes. During a cycle, the sum of all heat transfers is -170 kJ . The system completes 100 cycles per min. Complete the following table showing the method for each item, and compute the net rate if work output in kW .
- Process
- a-b
- b-c
- c-d
- d-a

21,000
-2,100
$Q \mathrm{~kJ} / \mathrm{min}$.
0

W (kJ/min)
2170
0
$\Delta E(k J / m i n)$
-
--36,600

- Ans.
a-b
$\mathrm{Q}=\Delta \mathrm{E}+\mathrm{W}$
$0=\Delta \mathrm{E}+2170$
$\Delta \mathrm{E}=-2170 \mathrm{~kJ} / \mathrm{min}$
b-c
$\mathrm{Q}=\Delta \mathrm{E}+\mathrm{W}$
$21,000=\Delta \mathrm{E}+0$
$\Delta \mathrm{E}=21,000 \mathrm{~kJ} / \mathrm{min}$
c-d
$\mathrm{Q}=\Delta \mathrm{E}+\mathrm{W}$
$-2100=-36,600+W$
$\mathrm{W}=34,500 \mathrm{~kJ} / \mathrm{min}$
$\cdot \varepsilon \mathrm{Q}=-170 \mathrm{~kJ}$
The system completes 100 cycles / min.
$\mathrm{Qab}+\mathrm{Qbc}+\mathrm{Qcd}+\mathrm{Qda}=-17,000 \mathrm{~kJ} / \mathrm{min}$.
$0+21,000-2100+\mathrm{Qda}=-17,000$
$\mathrm{Qda}=-35,900 \mathrm{~kJ} / \mathrm{min}$.
Now $\phi \mathrm{dE}=0$, since cyclic integral of any property is zero.
$\Delta \mathrm{E}_{\mathrm{ab}}+\Delta \mathrm{E}_{\mathrm{bc}}+\Delta \mathrm{E}_{\mathrm{cd}}+\Delta \mathrm{E}_{\mathrm{da}}=0$
$-21,70+21,000-36,000+\Delta \mathrm{E}_{\mathrm{da}}=0$
$\Delta \mathrm{E}_{\mathrm{da}}=17,770 \mathrm{~kJ} / \mathrm{min}$
$\mathrm{W}_{\mathrm{da}}=\mathrm{Q}_{\mathrm{da}}-\Delta \mathrm{E}_{\mathrm{da}}=-35,900-17,770=-53,670 \mathrm{~kJ} / \mathrm{min}$.

Since $\sum \mathrm{Q}=\sum \mathrm{W}$
Rate of work output $=-17,000 \mathrm{~kJ} / \mathrm{min}=-283.3 \mathrm{~kW}$

## PMM1

- The first law states the general principle of the conservation of energy. Energy is neither created nor destroyed, but only gets transformed from one form to another.
- There can be no machine which would continuously supply mechanical work without some other form of energy disappearing simultaneously.
- Such a fictitious machine is called a perpetual motion machine of the first kind, or in brief, PMMI. A PMMI is thus impossible.
- The converse of the above statement is also true, i.e. there can be no machine which would continuously consume work without some other form of energy appearing simultaneously.

- FIRST LAW APPLIED TO THERMODYNAMIC PROCESES
- A) CONSTANT VOLUME (ISOCHORIC PROCESS)

- 1) P-V-T Relation

$$
\begin{aligned}
& \mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2} \\
& \mathrm{~V}_{1}=\mathrm{V}_{2} \\
& \therefore \mathbf{P}_{\mathbf{1}} / \mathbf{T}_{\mathbf{1}}=\mathbf{P} \mathbf{2} / \mathbf{T}_{\mathbf{2}}
\end{aligned}
$$

- 2) Work Done

$$
\begin{aligned}
& { }_{1} \mathrm{~W}_{2}=\int \mathrm{PdV} \\
& \mathrm{dV}=0 \\
& \therefore \mathbf{W}_{\mathbf{2}}=\mathbf{0}
\end{aligned}
$$

- 3) Change in internal energy

$$
\Delta u=m C_{V}\left(T_{2}-T_{1}\right)
$$

- 4) Heat supplied

$$
\begin{aligned}
& { }_{1} \mathrm{Q}_{2}=\Delta \mathrm{U}+{ }_{1} \mathrm{~W}_{2} \\
& \operatorname{But}_{1} \mathrm{~W}_{2}=0 \\
& \therefore{ }_{1} \mathbf{Q}_{2}=\Delta \mathbf{U}=\mathbf{m C} \mathbf{C}_{\mathbf{V}}\left(\mathbf{T}_{\mathbf{2}}-\mathbf{T}_{1}\right)
\end{aligned}
$$

Q) 1 kg of air has a pressure of 3 bar and a temperature of $125^{\circ} \mathrm{C}$. After it has received 500 kJ of heat at constant volume, find the final temperature and change in pressure.

## Ans:

$$
\mathrm{m}=1 \mathrm{~kg}, \mathrm{Q}=500 \mathrm{~kJ}, \quad \mathrm{P}_{1}=3 \mathrm{bar}=3 \mathrm{x} 105 \mathrm{~N} / \mathrm{m}^{2}, \quad \mathrm{~T}_{1}=125^{\circ} \mathrm{C}=398 \mathrm{~K}
$$

$$
\mathrm{T}_{2}, \mathrm{P}_{2}=?
$$

$$
\begin{aligned}
& \mathrm{Q}_{2}=\mathrm{mcv}\left(\mathrm{~T}_{2}-\mathrm{T}_{1}\right) \\
& \mathrm{ie}, 500=1 \times 0.718\left(\mathrm{~T}_{2}-398\right) \\
& \mathrm{T}_{2}=1094.38 \mathrm{~K}=821.38^{\circ} \mathrm{C} \\
& \mathrm{P}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} / \mathrm{T}_{2} \\
& \mathrm{P}_{2}=\mathrm{P}_{\mathrm{I}} \mathrm{~T}_{2} / \mathrm{T}_{1}=(3 \times 1094.38) / 398=8.25 \mathrm{bar}
\end{aligned}
$$

- Q) An insulated cylinder of capacity $2.8 \mathrm{~m}^{3}$ contains 15 kg of nitrogen. Paddle work is done on the gas still the pressure inside the cylinder increases from 5 bar to 10 bar. Determine
(i) Change in internal energy
(ii) Work done
(iii) Heat transfer

Assume $\mathrm{c}_{\mathrm{p}}=1.04 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ and $\mathrm{c}_{\mathrm{v}}=0.7432 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$
Ans:

$$
\mathrm{V}_{1}=2.8 \mathrm{~m}^{3}, \quad \mathrm{~m}=15 \mathrm{~kg}, \quad \mathrm{p}_{1}=5 \mathrm{bar}=5 \times 105 \mathrm{~N} / \mathrm{m}^{2}
$$

$$
\mathrm{p}_{2}=10 \mathrm{bar}=10 \times 105 \mathrm{~N} / \mathrm{m}^{2}, \quad \mathrm{C}_{\mathrm{p}}=1.04 \mathrm{~kJ} / \mathrm{kg} \text { and } \mathrm{C}_{\mathrm{v}}=0.7432 \mathrm{~kJ} / \mathrm{kgK}
$$

$$
\Delta \mathrm{U}, \quad{ }_{1} \mathrm{~W}_{2}, \quad \mathrm{Q}_{2}=?
$$

$$
\begin{aligned}
& \mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{mRT}_{1} \\
& \mathrm{~T}_{1}=\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{mR}=\{5 \times 105 \times 2.8\} /\{15 \times(1.04-0.7432) \times 1000\}=314.47 \mathrm{~K}
\end{aligned}
$$

For constant volume process,

$$
\mathrm{P}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} / \mathrm{T}_{2}
$$

$$
\mathrm{T}_{2}=\mathrm{P}_{2} / \mathrm{P}_{1} \times \mathrm{T}_{1}=10 / 5 \times 314.47=628.94 \mathrm{~K}
$$

1) $\Delta U=m C_{v}\left(T_{2}-T_{1}\right)$

$$
=15 \times 0.7432(628.94-314.47)=3505.7 \mathrm{~kJ}
$$

2) $\quad{ }_{1} \mathrm{Q}_{2}-{ }_{1} \mathrm{~W}_{2}=\Delta \mathrm{U}$

$$
{ }_{1} \mathrm{~W}_{2}={ }_{1} \mathrm{Q}_{2}-\Delta \mathrm{U}
$$

As the cylinder is insulated ${ }_{1} \mathrm{Q}_{2}=0$.

$$
\left.{ }_{1} \mathrm{~W}_{2}=-\Delta \mathrm{U}=-3505.7 \mathrm{~kJ} \quad \text { (Paddle work is not zero }\right)
$$

3) $\quad Q_{2}=0$.
B) CONSTANT PRESSURE (ISOBARIC) PROCESS

Volume $\longrightarrow$

1) P-V-T Relation

$$
\begin{gathered}
\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2} \\
\mathrm{P}_{1}=\mathrm{P}_{2}
\end{gathered}
$$

$$
\mathrm{V}_{1} / \mathrm{T}_{1}=\mathrm{V}_{2} / \mathrm{T}_{2}
$$

$$
\begin{aligned}
& { }_{1} \mathrm{~W}_{2}=2 \int 1 \mathrm{PdV}=\mathrm{P}(\mathrm{~V}) \mathrm{v}_{2} \mathrm{v}_{1} \\

\end{aligned}
\end{aligned}
$$

- Q) A stationary mass of gas is compressed at constant pressure from an initial state of $2.5 \mathrm{~m}^{3}$ and 2 bar to a final volume of $1.5 \mathrm{~m}^{3}$. There is a transfer of 400 kJ of heat from the gas during compression. Find the change in internal energy of the gas.
Solution:
Given: $\mathrm{P}_{1}=\mathrm{P}_{2}=2 \mathrm{bar}=2 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$
$\mathrm{V}_{\mathrm{I}}=2.5 \mathrm{~m}^{3}, \quad \mathrm{~V}_{2}=1.5 \mathrm{~m}^{3}, \quad \mathrm{I}_{2}=-400 \mathrm{~kJ}$
$\Delta \mathrm{U}=$ ?
- For a constant pressure process,

$$
\begin{aligned}
{ }_{1} \mathrm{~W}_{2} & =\mathrm{P}\left(\mathrm{~V}_{2}-\mathrm{V}_{1}\right) \\
& =2 \times 10^{5}(1.5-2.5)=-2 \times 10^{5} \mathrm{~J} \\
{ }_{1} \mathrm{~W}_{2} & =-200 \mathrm{~kJ} \\
\Delta \mathrm{U} & ={ }_{1} \mathrm{Q}_{2}-{ }_{1} \mathrm{~W}_{2} \\
& =(-400)-(-200)=-200 \mathrm{~kJ}
\end{aligned}
$$

## C) CONSTANT TEMPERATURE (ISOTHERMAL) PROCESS

1) P-V-T Relation
$\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2}$
$\mathrm{T}_{1}=\mathrm{T}_{2}$
$\therefore \mathbf{P}_{\mathbf{1}} \mathbf{V}_{\mathbf{1}}=\mathbf{P}_{\mathbf{2}} \mathbf{V}_{\mathbf{2}}$

## 2) Work Done

$$
\begin{align*}
& { }_{1} \mathrm{~W}_{2}={ }^{\mathrm{V} 2} \mathrm{~J}_{1} \mathrm{PdV} \ldots \ldots \ldots \ldots \ldots  \tag{1}\\
& \mathrm{PV}=\text { a const or } \mathrm{PV}=\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} \\
& \mathrm{P}=\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{V}
\end{align*}
$$

Substituting in (1),

$$
\begin{aligned}
{ }_{1} \mathrm{~W}_{2} & ={ }^{\mathrm{v} 2} \int_{\mathrm{v}_{1}} \mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{V} \mathrm{dV} \\
& =\mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\mathrm{v} 2} \int_{\mathrm{v}_{1}} \mathrm{dV} / \mathrm{V} \\
& =\mathrm{P}_{1} \mathrm{~V}_{1}\left[\ln \mathrm{~V}^{\mathrm{v} 2}{ }_{\mathrm{v} 1}\right. \\
& =\mathrm{P}_{1} \mathrm{~V}_{1}\left(\ln \mathrm{~V}_{2}-\ln \mathrm{V}_{1}\right)
\end{aligned}
$$

$$
{ }_{1} \mathrm{~W}_{2}=\mathrm{P}_{1} \mathrm{~V}_{1} \ln \left(\mathrm{~V}_{2} / \mathrm{V}_{1}\right)
$$

$$
\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} \text { or } \mathrm{V}_{2} / \mathrm{V}_{1}=\mathrm{P}_{1} / \mathrm{P}_{2}
$$

$$
{ }_{1} \mathbf{W}_{2}=P_{1} V_{1} \ln \left(P_{1} / P_{2}\right)
$$

- 3) Change in internal energy
$\mathrm{T}_{1}=\mathrm{T}_{2}$
$\Delta \mathrm{U}=0$
- 4) Heat supplied
${ }_{1} \mathrm{Q}_{2}=\Delta \mathrm{U}+{ }_{1} \mathrm{~W}_{2}$
$\Delta \mathrm{U}=0$
${ }_{1} \mathbf{Q}_{2}={ }_{1} \mathbf{W}_{2}=P_{1} \mathbf{V}_{1} \ln \mathbf{V}_{2} / \mathbf{V}_{1}=P_{1} \mathbf{V}_{1} \ln \left(P_{1} / P_{2}\right)$
- Q) Determine the volume of 2 kg of air at $30^{\mathrm{D}} \mathrm{C}$ and under a pressure of 2 bar, what would be its volume after isothermal compression to a pressure of 4 bar , calculate the work done.
- Solution:
- Given: $\mathrm{m}=2 \mathrm{~kg}, \mathrm{~T}_{1}=30^{\circ} \mathrm{C}=303 \mathrm{~K}, \mathrm{P}_{1}=2 \mathrm{bar}=2 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$, $\mathrm{P}_{2}=4 \mathrm{bar}=4 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$,
$\mathrm{V}_{1}, \mathrm{~V}_{2},{ }_{1} \mathrm{~W}_{2}=$ ?
$\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{mRT}_{1}$
$\mathrm{V}_{1}=\mathrm{mRT}_{1} / \mathrm{P}_{1}=(2 \times 287 \times 303) /\left(2 \times 10^{5}\right)$
$\mathrm{V}_{1}=0.8696 \mathrm{~m}^{3}$

For iso thermal process,
$\mathrm{P}_{1} \mathrm{~V}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2}$

$$
\begin{aligned}
\mathrm{V}_{2} & =\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{P}_{2}=\left(2 \times 10^{5} \times 0.8696\right) /\left(4 \times 10^{5}\right) \\
\mathrm{V}_{2} & =0.4348 \mathrm{~m}^{3} \\
{ }_{1} \mathrm{~W}_{2} & =\mathrm{P}_{1} \mathrm{~V}_{1} \ln \left(\mathrm{~V}_{2} / \mathrm{V}_{1}\right) \\
& =2 \times 10^{5} \times 0.8696 \times \ln (0.4348 / 0.8696) \\
{ }_{1} \mathrm{~W}_{2} & =-120.55 \mathrm{~kJ}
\end{aligned}
$$

## - D) ADIABATIC PROCESS

- In an adiabatic process, the gas neither receives nor rejects heat. In this process, the heat exchange $\mathrm{Q}=0$. Work is done by the gas at the expense of internal energy.

$$
\begin{align*}
& { }_{1} \mathrm{~W}_{2}={ }^{\mathrm{D} 2} \int_{\mathrm{V}_{1}} \mathrm{PdV} \\
& \mathrm{Q}_{2}=\Delta \mathrm{U}+{ }_{1} \mathrm{~W}_{2} \\
& \mathrm{Q}_{2}=0 \\
& \therefore \mathrm{Q}_{2}=-\Delta \mathrm{U}=-\mathrm{mC}_{\mathrm{V}}\left(\mathrm{~T}_{2}-\mathrm{T}_{1}\right) \\
& { }_{1} \mathrm{~W}_{2}={ }^{\nu 2} \int_{\mathrm{V}_{1}} \mathrm{PdV}=-\mathrm{mC}_{\mathrm{V}}\left(\mathrm{~T}_{2}-\mathrm{T}_{1}\right) \\
& \mathrm{ie} ; \operatorname{PdV}=-\mathrm{mC}_{\mathrm{V}} \mathrm{dT} \ldots \ldots \ldots \ldots . .(1) \tag{1}
\end{align*}
$$

$\mathrm{PV}=\mathrm{mRT}$
Differentiating, $\mathrm{PdV}+\mathrm{Vdp}=\mathrm{mRdT}$
ie; $m d T=\{P d V+V d p\} / R$
Substituting for mdT in (1), we get;

$$
\mathrm{PdV}=-\mathrm{C}_{\mathrm{V}}\left\langle\frac{\mathrm{PdV}+\mathrm{Vdp}\}}{\mathrm{R}}\right.
$$

$$
\begin{aligned}
& \text { ie; } \mathrm{R} P d V=-\mathrm{C}_{\mathrm{V}}(\mathrm{PdV}+\mathrm{Vdp}) \\
& \mathrm{R}=\mathrm{Cp}-\mathrm{C}_{\mathrm{V}} \\
& \therefore\left(\mathrm{Cp}-\mathrm{C}_{\mathrm{V}}\right) P d V=-\mathrm{C}_{\mathrm{V}} \mathrm{PdV}-\mathrm{Vdp} \\
& \text { ie; } \mathrm{Cp} \operatorname{PdV}=-\mathrm{C}_{\mathrm{V}} \mathrm{Vdp} \\
& \quad \frac{\mathrm{Cp}}{\mathrm{C}_{\mathrm{V}}} \frac{d V}{V}=\frac{-d P}{P} \\
& C \mathrm{Cp} / \mathrm{C}_{\mathrm{V}}=\gamma \\
& \gamma(\mathrm{dV} / \mathrm{V})+\mathrm{dP} / \mathrm{P}=0
\end{aligned}
$$

Integerating the above equation, $\gamma \ln \mathrm{V}+\ln \mathrm{P}=\mathrm{C}_{1}$
where $C_{1}$ is the constant of integration.
ie; $\ln \mathrm{PV}^{\gamma}=\mathrm{C}_{1}$
or $\mathrm{PV}^{\gamma}=\mathrm{C}$ where C is another constant.
ie. $\mathrm{P}_{1} \mathrm{~V}_{1}^{\gamma}=\mathrm{P}_{2} \mathrm{~V}_{2}^{\gamma}=$ constant.

1) P-V-T Relation

$$
\mathrm{P}_{1} \mathrm{~V}_{1}^{\gamma}=\mathrm{P}_{2} \mathrm{~V}_{2}{ }^{\gamma}
$$

$$
\therefore P_{1} / \mathbf{P}_{2}=\left(\mathbf{V}_{2} / \mathbf{V}_{1}\right)^{\gamma} \quad \text { or } \quad V_{2} / V_{1}=\left(P_{1} / P_{2}\right)^{1 / \gamma} \ldots \ldots \ldots \ldots(1)
$$

$$
\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2}
$$

$$
\begin{equation*}
\mathrm{V}_{2} / \mathrm{V}_{1}=\left(\mathrm{T}_{2} / \mathrm{T}_{1}\right) \times\left(\mathrm{P}_{1} / \mathrm{P}_{2}\right) \tag{2}
\end{equation*}
$$

From (1) \& (2);
$\left(\mathrm{P}_{1} / \mathrm{P}_{2}\right)^{1 / \gamma}=\left(\mathrm{T}_{2} / \mathrm{T}_{1}\right) \times\left(\mathrm{P}_{1} / \mathrm{P}_{2}\right)$
$\mathrm{T}_{2} / \mathrm{T}_{1}=\left(\mathrm{P}_{1} / \mathrm{P}_{2}\right)^{1 / \gamma-1}$
$\mathbf{T}_{\mathbf{2}} / \mathbf{T}_{1}=\left(\mathbf{P}_{1} / \mathbf{P}_{2}\right)^{1-\gamma / \gamma}$

$$
\begin{aligned}
& \text { or } \mathrm{P}_{1} / \mathrm{P}_{2}=\left(\mathrm{T}_{2} / \mathrm{T}_{1}\right)^{\gamma / 1-\gamma}=\left(\mathrm{T}_{1} / \mathrm{T}_{2}\right)^{\gamma / \gamma-1} \\
& \text { ie. } \mathbf{P}_{1} / \mathbf{P}_{2}=\left(\mathbf{V}_{\mathbf{2}} / \mathbf{V}_{1}\right)^{\gamma}=\left(\mathbf{T}_{1} / \mathbf{T}_{2}\right)^{\gamma / \gamma-1} \\
& \left(V_{2} / V_{1}\right)=\left(T_{1} / T_{2}\right)^{1 / \gamma-1} \\
& \text { 2) Work Done } \\
& { }_{1} \mathrm{~W}_{2}={ }^{\mathrm{v} 2} \int \mathrm{v}_{1} \mathrm{PdV} \\
& \mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\gamma}=\mathrm{P}_{2} \mathrm{~V}_{2}^{\gamma}=\mathrm{PV}^{\gamma}=\mathrm{C} \\
& \mathbf{P}=\mathbf{C} / \mathbf{V}^{\gamma} \\
& { }_{1} \mathrm{~W}_{2}={ }^{\mathrm{v} 2} \int_{\mathrm{v}_{1}} \mathrm{CdV} / \mathrm{V}^{\gamma} \\
& =\mathrm{C}^{\mathrm{v} 2} \int_{\mathrm{v}_{1}} \mathrm{~V}^{-\gamma} \mathrm{dV} \\
& =C\left[\frac{V^{Y+1}}{-Y+1}\right]^{V_{1}}
\end{aligned}
$$

$$
\begin{aligned}
& =\mathrm{C} /(1-\gamma)\left\{\mathrm{V}_{2}^{-\mathrm{r}+1}-\mathrm{V}_{1}^{-\mathrm{r}+1\}}\right. \\
& \mathrm{C}=\mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\gamma}=\mathrm{P}_{2} \mathrm{~V}_{2}{ }^{\gamma} \\
& { }_{1} \mathrm{~W}_{2}=1 /(1-\gamma)\left\{\mathrm{P}_{2} \mathrm{~V}_{2}{ }^{\gamma} \mathrm{V}_{2}^{-\gamma+1}-\mathrm{P}_{1} \mathrm{~V}_{1} \gamma \mathrm{~V}_{1}{ }^{-\gamma+1}\right\} \\
& =1 /(1-\gamma)\left\{P_{2} \mathrm{~V}_{2}^{-\gamma+\gamma+1}-\mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\gamma-\gamma+1}\right\} \\
& =1 /(1-\gamma)\left\{\mathrm{P}_{2} \mathrm{~V}_{2}-\mathrm{P}_{1} \mathrm{~V}_{1}\right\} \\
& { }_{1} \mathbf{W}_{2}=\left(\mathbf{P}_{2} \mathbf{V}_{\mathbf{2}}-\mathbf{P}_{1} \mathbf{V}_{1}\right) / \mathbf{1 - \gamma} \\
& { }_{1} \mathbf{W}_{2}=\left(\mathbf{P}_{1} \mathbf{V}_{1}-\mathbf{P}_{2} \mathbf{V}_{2}\right) / \gamma-1=m R\left(T_{1}-T_{2}\right) / \gamma-1 \\
& { }_{1} W_{2}=\Delta U=-\mathrm{mC}_{\mathrm{V}} \Delta T
\end{aligned}
$$

3) Change in internal energy

$$
\Delta U=-\mathrm{mC}_{\mathrm{V}} \Delta T=-1 \mathbf{W}_{2}
$$

4) Heat Exchanged

$$
Q=0
$$

- Q) 1 kg of gas expands adiabatically and its temperature is observed to fall from $240^{\circ} \mathrm{C}$ to $115^{\circ} \mathrm{C}$ while the volume is doubled. The gas does 90 kJ of work in the process. Determine the value of $\mathrm{C}_{\mathrm{p}}$ and $\mathrm{C}_{\mathrm{v}}$.
- Solution;
- $\mathrm{m}=1 \mathrm{~kg}, \quad \mathrm{~T}_{1}=240^{\circ} \mathrm{C}=513 \mathrm{~K}, \quad \mathrm{~T}_{2}=115^{0} \mathrm{C}=388 \mathrm{~K}, \quad{ }_{1} \mathrm{~W}_{2}=90 \mathrm{~kJ}, \quad \mathrm{~V}_{2} / \mathrm{V}_{1}=2$
$\mathrm{C}_{\mathrm{p}}$ and $\mathrm{C}_{\mathrm{v}}=$ ?
${ }_{1} \mathrm{Q}_{2}=\Delta \mathrm{U}+{ }_{1} \mathrm{~W}_{2}$
${ }_{1} Q_{2}=0$
$\therefore \Delta \mathrm{U}=-{ }_{1} \mathrm{~W}_{2}$
$\mathrm{mC}_{\mathrm{V}} \Delta \mathrm{T}=-_{1} \mathrm{~W}_{2}$
$\mathrm{C}_{\mathrm{V}}={ }_{-1} \mathrm{~W}_{2} / \mathrm{m}\left(\mathrm{T}_{2}-\mathrm{T}_{1}\right)=-90 / 1 \times(388-513)$
$\mathrm{C}_{\mathrm{V}}=0.72 \mathrm{~kJ} / \mathrm{kgK}$
$\left(\mathrm{T}_{1} / \mathrm{T}_{2}\right)^{\gamma / \gamma-1=}\left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)^{\gamma}$
$513 / 388=2^{\gamma-1}$
$1.322=2^{\gamma-1}$

Taking logarithm,
$\ln 1.322=(\gamma-1) \ln 2$
$\gamma-1=0.4$
$\gamma=1.4$
$\mathrm{C}_{\mathrm{p}}=\gamma \mathrm{C}_{\mathrm{V}}=1.4 \times 0.72=1.008 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$

- Q) Find the work done in compressing 0.28 m 3 of air at a pressure of 1.4 bar to a volume of 0.028 m 3 when the compression is adiabatic and isothermal.
- Solution;
- $\mathrm{V}_{1}=0.28 \mathrm{~m}^{3}, \mathrm{P}_{1}=1.4 \mathrm{bar}=1.4 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$
- $\mathrm{V}_{2}=0.028 \mathrm{~m}^{3}$
- W adiabatic, W isothermal $=$ ?
- For adiabatic process,

$$
\begin{aligned}
\mathrm{P}_{2} / \mathrm{P}_{1} & =\left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)^{\gamma} \\
\mathrm{P}_{2} & =\mathrm{P}_{1}\left(\mathrm{~V}_{2} / \mathrm{V}_{1}\right)^{\gamma}=1.4 \times 10^{5}(0.28 / 0.028)^{1.4} \\
& =35.17 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2} \\
{ }_{1} \mathrm{~W}_{2} & =\left(\mathrm{P}_{2} \mathrm{~V}_{2}-\mathrm{P}_{1} \mathrm{~V}_{1}\right) / 1-\gamma \\
& =\{1.4 \times 105 \times 0.28-35.17 \times 105 \times 0.028\} / 1.4-1=-148190 \mathrm{~J}
\end{aligned}
$$

- For isothermal process,
- ${ }_{1} \mathrm{~W}_{2}=\mathrm{P}_{1} \mathrm{~V}_{1} \ln \left(\mathrm{~V}_{2} / \mathrm{V}_{1}\right)$

$$
=1.4 \times 105 \times 0.28 \times \ln (0.028 / 0.28)=-90261.33 \mathrm{~J}
$$

- The difference in work done $=-148190-(-90261.33)=57928.67 \mathrm{~J}$
- Q) $3.5 \mathrm{~m}^{3}$ of hydrogen gas at a pressure of 100 kPa and $20^{\circ} \mathrm{C}$ are compressed adiabatically to 4.5 times its original pressure. It is then expanded isothermally to its original volume. Determine the final pressure of the gas and the heat transfer. Also determine the quantity of heat that is to be exchanged to reduce the gas to its original pressure and volume. Take Cp for hydrogen as $14.3 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}$ and $\gamma$ a s 1.4.
- Solution;
- $\mathrm{V}_{1}=3.5 \mathrm{~m}^{3}, \quad \mathrm{P}_{1}=100 \mathrm{kPa}=100 \times 10^{3} \mathrm{~N} / \mathrm{m}^{2}, \quad \mathrm{~T}_{1}=20^{0} \mathrm{C}=293 \mathrm{~K}$

$$
\mathrm{P}_{2}=4.5 \mathrm{P}_{1}=4.5 \times 100 \times 10^{3}=450 \times 10^{3} \mathrm{~N} / \mathrm{m}^{2}, \quad \mathrm{Cp}=14.3 \mathrm{~kJ} / \mathrm{kg} \mathrm{~K}
$$

$$
\mathrm{V}_{3}=\mathrm{V}_{1}, \quad \gamma=1.4
$$

$$
\mathrm{P}_{3},{ }_{3} \mathrm{Q}_{1},{ }_{2} \mathrm{Q}_{3}=?
$$

- $\mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\gamma}=\mathrm{P}_{2} \mathrm{~V}_{2}^{\gamma}$
- $100 \times 10^{3} \times 3.5^{1.4}=450 \times 10^{3}$ x V $_{2}{ }^{1.4}$
$\mathrm{V}_{2}=1.2 \mathrm{~m}^{3}$
- $\mathrm{P}_{1} \mathrm{~V}_{1} / \mathrm{T}_{1}=\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{T}_{2}$
$\mathrm{T}_{2}=\left\{\mathrm{P}_{2} \mathrm{~V}_{2} / \mathrm{P}_{1} \mathrm{~V}_{1}\right\} \times \mathrm{T}_{1}=\left\{450 \times 10^{3} \times 1.2 / 100 \times 10^{3} \times 3.5\right\} \times 293=452 \mathrm{~K}$

For the process 2-3,
$P_{2} V_{2}=P_{3} V_{3}$
$450 \times 10^{3} \times 1.2=\mathrm{P}_{3} \times 3.5$
$\mathrm{P}_{3}=1.54 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$

- Heat transferred,

$$
\begin{aligned}
{ }_{2} \mathrm{Q}_{3} & =\mathrm{P}_{2} \mathrm{~V}_{2} \ln \left(\mathrm{~V}_{3} / \mathrm{V}_{2}\right) \\
& =450 \times 103 \times 1.2 \times \ln (3.5 / 1.2) \\
{ }_{2} \mathrm{Q}_{3} & =578 \mathrm{~kJ} \\
& \\
{ }_{3} \mathrm{Q}_{1} & -{ }_{3} \mathrm{~W}_{1}=\Delta \mathrm{U} \\
{ }_{3} \mathrm{Q}_{1} & =\Delta \mathrm{U} \quad \text { since }{ }_{3} \mathrm{~W}_{1}=0 \\
& =m C v\left(\mathrm{~T}_{1}-\mathrm{T}_{3}\right)
\end{aligned}
$$

$$
\mathrm{Cp}-\mathrm{Cv}=\mathrm{R}=8314 / \mathrm{M}=8314 / 2=4157 \mathrm{~J} / \mathrm{kgK}
$$

$$
\therefore \mathrm{Cv}=\mathrm{Cp}-\mathrm{R}=14300-4157=10143 \mathrm{~J} / \mathrm{kgK}
$$

## E) POLYTROPIC PROCESS

- The curve of expansion or compression follows the law $\mathrm{PVn}=$ const, where ' $n$ ' is a constant called polytropic index of expansion or compression.

- 1) P-V-T Relation

$$
\mathbf{P}_{1} / \mathbf{P}_{2}=\left(\mathbf{V}_{2} / \mathbf{V}_{1}\right)^{\mathbf{n}}
$$

$$
\left(V_{2} / V_{1}\right)=\left(T_{1} / T_{2}\right)^{1 / n-1}
$$

$$
T_{2} / T_{1}=\left(\mathbf{P}_{1} / \mathbf{P}_{2}\right)^{1-n / n}
$$

- 2) Work done

$$
\begin{aligned}
&{ }_{1} \mathrm{~W}_{2}={ }^{\mathrm{V} 2} \int_{\mathrm{V}_{1}} \mathrm{PdV} \\
& \mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\mathrm{n}}=\mathrm{P}_{2} \mathrm{~V}_{2}{ }^{\mathrm{n}}=\mathrm{PV}^{\mathrm{n}}=\mathrm{C} \\
& \mathbf{P}=\mathbf{C} / \mathbf{V}^{\mathrm{n}} \\
&{ }_{1} \mathrm{~W}_{2}={ }^{\mathrm{V} 2} \int_{\mathrm{V}_{1} \mathrm{C}} \mathrm{dV} / \mathrm{V}^{\mathrm{n}} \\
&=\mathrm{C}^{2} \int \mathrm{~V}_{1} \mathrm{~V}^{-n} \mathrm{dV}
\end{aligned}
$$

$$
\begin{aligned}
& =C\left[\begin{array}{c}
\frac{\mathrm{V}^{-n \mathrm{n}+1}}{-\mathrm{n}+1}
\end{array} \mathrm{~V}_{1}^{\mathrm{V}_{2}}\right. \\
& =\mathrm{C} /(1-\mathrm{n})\left\{\mathrm{V}_{2}^{-\mathrm{n}+1}-\mathrm{V}_{1}^{-\mathrm{n}+1\}}\right. \\
& \mathrm{C}=\mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\mathrm{n}}=\mathrm{P}_{2} \mathrm{~V}_{2}{ }^{\mathrm{n}} \\
& \square_{1} \mathrm{~W}_{2}=1 /(1-\mathrm{n})\left\{\mathrm{P}_{2} \mathrm{~V}_{2}{ }^{\mathrm{n}} \mathrm{~V} 2^{-\mathrm{n}+1-} \mathrm{P}_{1} \mathrm{~V}_{1}{ }^{\mathrm{n}} \mathrm{~V}_{1}{ }^{-\mathrm{n}+1}\right\} \\
& =1 /(1-n)\left\{P_{2} V_{2}^{-n+n+1}-P_{1} V_{1}^{n-n+1}\right\} \\
& =1 /(1-\mathrm{n})\left\{\mathrm{P}_{2} \mathrm{~V}_{2}-\mathrm{P}_{1} \mathrm{~V}_{1}\right\} \\
& { }_{1} W_{2}=\left(P_{2} V_{2}-P_{1} V_{1}\right) / 1-n \\
& { }_{1} W_{2}=\left(P_{1} V_{1}-P_{2} V_{2}\right) / n-1=m R\left(T_{1}-T_{2}\right) / n-1
\end{aligned}
$$

- 3) Change in internal energy

## $\Delta \mathrm{U}=\mathrm{mCv} \Delta \mathrm{T}$

Heat exchanged ${ }_{1} \mathrm{Q}_{2}=\Delta \mathrm{U}+{ }_{1} \mathrm{~W}_{2}$

$$
\begin{aligned}
{ }_{1} \mathrm{Q}_{2} & =\mathrm{mCv}\left(\mathrm{~T}_{2}-\mathrm{T}_{1}\right)+\mathrm{mR} /(\mathrm{n}-1)\left\{\mathrm{T}_{2}-\mathrm{T}_{1}\right\} \\
& =\mathrm{m}\left(\mathrm{~T}_{2}-\mathrm{T}_{1}\right)\{\mathrm{R} /(\mathrm{n}-1)-\mathrm{Cv}\}
\end{aligned}
$$

$$
\text { But } \mathrm{Cv}=\mathrm{R} /(\gamma-1)
$$

$$
\begin{aligned}
\therefore \mathrm{Q}_{2} & =\mathrm{m}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)\{\mathrm{R} /(\mathrm{n}-1)-\mathrm{R} /(\gamma-1)\} \\
& =\mathrm{mR}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)\{1 /(\mathrm{n}-1)-1 /(\gamma-1)\} \\
& =\mathrm{mR}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)\{(\gamma-1-\mathrm{n}+1) /(\mathrm{n}-1)(\gamma-1)\} \\
& =\mathrm{mR}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right)\{(\gamma-\mathrm{n}) /(\mathrm{n}-1)(\gamma-1)\} \\
& =(\gamma-\mathrm{n}) /(\gamma-1)\left\{\mathrm{mR}\left(\mathrm{~T}_{1}-\mathrm{T}_{2}\right) /(\mathrm{n}-1)\right\}
\end{aligned}
$$

$$
\text { ie }_{1} \mathbf{Q}_{2}=(\gamma-n) /(\gamma-1) x \text { Work done }
$$

- Expression for polytropic index
$P_{1} V_{1}{ }^{n}=P_{2} V_{2}{ }^{n}$
$\mathrm{P}_{1} / \mathrm{P}_{2}=\left(\mathrm{V}_{2} / \mathrm{V} 1\right)^{\mathrm{n}}$
Taking logarithm,
- Q) A certain quantity of air has a volume of $0.028 \mathrm{~m}^{3}$ at a pressure of 1.25 bar and $25^{0} \mathrm{C}$. It is
compressed to a volume of $0.0042 \mathrm{~m}^{3}$ according to the law $\mathrm{PV}^{1.3}$ constant. Find the final
temperature and work done during compression. Also determine the reduction in pressure at a

Q) A certain quantity of air has a volume of $0.028 \mathrm{~m}^{3}$ at a pressure of 1.25 bar and $25^{0} \mathrm{C}$. It is
compressed to a volume of $0.0042 \mathrm{~m}^{3}$ according to the law $\mathrm{PV}^{1.3}$ constant. Find the final
temperature and work done during compression. Also determine the reduction in pressure at a constant volume required to bring the air back to its original volume.
- Solution;
- $\mathrm{V}_{1}=0.028 \mathrm{~m}^{3}, \quad \mathrm{~V}_{2}=0.0042 \mathrm{~m}^{3}, \quad \mathrm{n}=1.3, \quad \mathrm{~T}_{1}=25^{\circ} \mathrm{C}=298 \mathrm{~K}, \quad \mathrm{~T}_{3}=\mathrm{T}_{1}=298 \mathrm{~K}$
- $\mathrm{P}_{1}=1.25 \mathrm{bar}=1.25 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$
- $\mathrm{T}_{2},{ }_{1} \mathrm{~W}_{2},\left(\mathrm{P}_{2}-\mathrm{P}_{3}\right)=$ ?

$$
\begin{aligned}
& \ln \left(\mathrm{P}_{1} / \mathrm{P}_{2}\right)=\mathrm{n} \ln \left(\mathrm{~V}_{2} / \mathrm{V}_{1}\right) \\
& \mathrm{n}=\ln \left(\mathrm{P}_{1} / \mathrm{P}_{2}\right) / \ln \left(\mathrm{V}_{2} / \mathrm{V}_{1}\right.
\end{aligned}
$$

For the polytropic process,
$\left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)=\left(\mathrm{T}_{1} / \mathrm{T}_{2}\right)^{1 / \mathrm{n}-1}$
ie, $\mathrm{T}_{1} / \mathrm{T}_{2}=\left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)^{\mathrm{n}-1}$
$\mathrm{T}_{2}=\mathrm{T}_{1} /\left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)^{\mathrm{n}-1}=298 /\{0.0042 / 0.028\}^{1.3-1}=526.49 \mathrm{~K}$
$\mathbf{P}_{1} / \mathbf{P}_{2}=\left(\mathbf{V}_{2} / \mathbf{V}_{1}\right)^{\mathbf{n}}$

$$
\mathrm{P}_{2}=\mathrm{P}_{1} /\left(\mathrm{V}_{2} / \mathrm{V}_{1}\right)^{\mathrm{n}}=1.25 \times 10^{5} /\{0.0042 / 0.028\}^{1.3}=14.723 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}
$$

$$
{ }_{1} \mathbf{W}_{2}=\left(P_{1} V_{1}-P_{2} V_{2}\right) / n-1
$$

$$
{ }_{1} \mathrm{~W}_{2}=\left(1.25 \times 10^{5} \times 0.028-14.723 \times 10^{5} \times 0.0042\right) /(1.3-1)=-8.946 \mathrm{~kJ}
$$

- For the constant volume process 2-3,

$$
\begin{aligned}
& \mathrm{P}_{3} / \mathrm{T}_{3}=\mathrm{P}_{2} / \mathrm{T}_{2} \\
& \mathrm{P}_{3}=\mathrm{P}_{2} / \mathrm{T}_{2} \times \mathrm{T}_{3}=\left(14.723 \times 10^{5} \times 298\right) / 526.49=8.33 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2} \\
& \mathrm{P}_{2}-\mathrm{P}_{3}=14.723 \times 10^{5}-8.33 \times 10^{5}=6.393 \mathrm{bar}
\end{aligned}
$$

## - FIRST LAW OF THERMODYNAMICS APPLIED TO OPEN SYSTEMS

- A large number of engineering devices such as turbines, compressors, and nozzles operate for long periods of time under the same conditions once the transient start-up period is completed and steady operation is established, and are classified as steady-flow devices.
- Processes involving such devices can be represented reasonably well by a somewhat idealized process, called the steady-flow process.
- That is, the fluid properties can change from point to point within the control volume, but at any point, they remain constant during the entire process.
(Steady means no change with time.)
- Thus, the volume V , the mass m , and the total energy content E of the control volume remain constant and the total mass or energy entering the control volume must be equal to the total mass or energy leaving it (since $\mathrm{m}_{\mathrm{cv}}=$ constant and $\mathrm{E}_{\mathrm{cv}}=$ constant).
- Consider an open system having an inlet at section 1-1 and outlet at section $2-2$.
- The cross sectional area, pressure, specific volume, mass flow rate at $1-1 \& 2-2$ are;
- $=>\mathrm{A}_{1}, \mathrm{P}_{1}, \mathrm{v}_{1}, \mathrm{~m}_{1}$
- $2-2=>A_{2}, P_{2}, \mathrm{v}_{2}, \mathrm{~m}_{2}$
- The fluid flowing across the control surface enters \& leaves with an amount of energy per unit mass.
- $\mathrm{e}_{1}=\mathrm{u}_{1}+1 / 2 \mathrm{C}_{1}^{2}+\mathrm{gz}_{1}$
- $e_{2}=u_{2}+1 / 2 C_{2}^{2}+\mathrm{gz}_{2}$ for $1-1 \& 2-2$ respectively

- Again as the amount of mass flows in there is a pressure at its back surface so that it is being pushed by the mass behind it, which is the surroundings.
- Which is the work flowing in similarly the fluid flowing out must push the surrounding fluid ahead of it doing work on it, which work is leaving the open system.
- Flow work = Force x velocity

$$
\begin{aligned}
& =\int \mathrm{PdA} x \text { velocity } \quad(\mathrm{AC}=\mathrm{V}) \\
& =\mathrm{PV}=\mathrm{Pvm}
\end{aligned}
$$

$\therefore$ Flow work in $=\mathrm{P}_{1} \mathrm{v}_{1} \mathrm{~m}_{1}$

- Flow work out $=\mathrm{P}_{2} \mathrm{v}_{2} \mathrm{~m}_{2}$
- $\therefore$ The total energy associated with the flow of mass $=$ [Stored energy + flow energy $]$

$$
\begin{aligned}
& (\mathrm{e}+\mathrm{Pv}) \mathrm{m}=\left[(\mathrm{u}+\mathrm{Pv})+1 / 2 \mathrm{C}^{2}+\mathrm{gz}\right] \mathrm{m} \\
& \text { ie, }(\mathrm{e}+\mathrm{Pv}) \mathrm{m}=\left(\mathrm{h}+1 / 2 \mathrm{C}^{2}+\mathrm{gz}\right) \mathrm{m} \\
& \text { ie, } \mathrm{m}_{1}\left(\mathrm{e}_{1}+\mathrm{P}_{1} \mathrm{v}_{1}\right) \text { for } 1-1 \\
& \mathrm{~m}_{2}\left(\mathrm{e}_{2}+\mathrm{P}_{2} \mathrm{v}_{2}\right) \quad \text { for } 2-2
\end{aligned}
$$

Let the open system is also having heat \& work interactions, Q \& W
The change in energy due to heat $\&$ work interaction $=\mathrm{Q}-\mathrm{W}$.
The fundamental law states that we cannot create or destroy energy such that the change of energy must be caused by energy into or out of the open system (control of volume).

- So the total change in energy for the system
- $\Delta \mathrm{E}_{\mathrm{cv}}=[\mathrm{Q}-\mathrm{W}]+\left[\mathrm{m}_{1}\left(\mathrm{e}_{1}+\mathrm{p}_{1} \mathrm{v}_{1}\right)-\mathrm{m}_{2}\left(\mathrm{e}_{2}+\mathrm{P}_{2} \mathrm{v}_{2}\right)\right]$
- ie, $\Delta \mathrm{E}_{\mathrm{cv}}=\mathrm{Q}-\mathrm{W}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+1 / 2 \mathrm{C}_{1}^{2}+\mathrm{gz}_{1}\right)-\mathrm{m}_{2}\left(\mathrm{~h}_{2}+1 / 2 \mathrm{C}_{2}^{2}+\mathrm{gz}_{2}\right)$
- During a steady- flow process, the total energy content of the control volume is constant ie change in energy $\Delta \mathrm{E}_{\mathrm{cv}}=0$, then
- $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+1 / 2 \mathrm{C}_{1}^{2}+\mathrm{gZ}_{1}\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+1 / 2 \mathrm{C}_{2}^{2}+\mathrm{gz}_{2}\right)$
- ie, the amount o energy entering a control volume in all forms (by heat, work \& mass) must be equal to the amount of energy leaving it. There is no accumulation of mass or energy within the control volume \& the properties of any location within the control volume will not change with time.
- By equation of continuity, $\mathrm{m}_{\mathrm{i}}=\mathrm{m}_{\mathrm{e}}$
- ie, $\mathrm{A}_{1} \mathrm{C}_{1} / \mathrm{v}_{1}=\mathrm{A}_{2} \mathrm{C}_{2} / \mathrm{v}_{2}$
- For a system of perfectly insulated type, $\mathrm{Q}=0$
- $\left(\mathrm{h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{gz}_{1}\right) \mathrm{m}_{1}=\mathrm{W}+\left(\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{gz}_{2}\right) \mathrm{m}_{2}$
- b) For any system having more than one inlets, outlets and energy interactions.
- Net heat added, $\mathrm{Q}=\mathrm{Q}_{1}-\mathrm{Q}_{2}+\mathrm{Q}_{3}$
- Net work done, $\mathrm{W}=\mathrm{W}_{1}+\mathrm{W}_{2}$

$\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{gz}_{1}\right)+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{gz}_{2}\right)=\mathrm{W}+\mathrm{m}_{3}\left(\mathrm{~h}_{3}+\mathrm{C}_{3}^{2} / 2+\mathrm{gz}_{3}\right)+\mathrm{m}_{4}\left(\mathrm{~h}_{4}+\mathrm{C}_{4}^{2} / 2+\mathrm{gz}_{4}\right)$
- It is a device which produces shaft work at the expense of the pressure of the working fluid.
- $\mathrm{Q}+\left(\mathrm{h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{gz}_{1}\right) \mathrm{m}_{1}=\mathrm{W}+\left(\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{gz}_{2}\right) \mathrm{m}_{2}$
- $\mathrm{m}_{1}=\mathrm{m}_{2}$
- KE \& PE changes are negligible.
- The expansion is assumed to be adiabatic ie; $\mathrm{Q}=0$.
- $\therefore \mathrm{mh}_{1}=\mathrm{W}+\mathrm{mh}_{2}$
- $W=m\left(h_{1}-h_{2}\right)=m C p\left(T_{1}-T_{2}\right)$

- ie. Work is done by the fluid at the expense of its enthalpy.
- In both compressor and pump the pressure of the fluid is increased by putting in shaft work.
- $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{gz}_{1}\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{gz}_{2}\right)$
- $\Delta \mathrm{PE}=0, \quad \mathrm{Q}=0, \quad \mathrm{~m}_{1}=\mathrm{m}_{2}, \quad \mathrm{C}_{1}$ is negligible
- $\therefore \mathrm{mh}_{1}=\mathrm{w}+\mathrm{mh}_{2}+\mathrm{C}_{2}^{2} / 2$
- $\therefore \mathrm{W}=\mathrm{m}\left(\mathrm{h}_{1}-\mathrm{h}_{2}\right)-\mathrm{C}_{2}^{2} / 2$
- If $\mathrm{C}_{2}$ is also neglected
- $\mathrm{W}=\mathrm{m}\left(\mathrm{h}_{1}-\mathrm{h}_{2}\right)=\mathrm{mCp}\left(\mathrm{T}_{1}-\mathbf{T}_{2}\right)$

- But W is negative as it is work input in this case

## - HEAT EXCHANGER /CONDENSER

- A heat exchanger is a device in which heat is transferred from one fluid to another.
- Figure shows a steam condenser, where steam condenses outside the tubes \& cooling water flows through the tubes.
- $\Delta \mathrm{KE}=0, \quad \Delta \mathrm{PE}=0, \quad \mathrm{Q}=0, \quad \mathrm{~W}=0$
- $\mathrm{w}_{\mathrm{c}} \mathrm{h}_{1+}+\mathrm{w}_{\mathrm{s}} \mathrm{h}_{2}=\mathrm{w}_{\mathrm{c}} \mathrm{h}_{3+}+\mathrm{w}_{\mathrm{s}} \mathrm{h}_{4}$
- ie. $w_{c}\left(h_{1}-h_{3}\right)=w_{s}\left(h_{4}-h_{2}\right)$

- Boiler is the device used for steam generation at const pressure. Heat is supplied externally to the boiler for steam generation upon state of steam desired.
- $\mathrm{W}=0, \quad \Delta \mathrm{KE}=0, \quad \Delta \mathrm{PE}=0, \quad \mathrm{~m}_{1}=\mathrm{m}_{2}$
- $\mathrm{Q}+\mathrm{mh}_{1}=\mathrm{mh}_{2}$
- $Q=m\left(h_{2}-h_{1}\right)=m C p\left(T_{2}-T_{1}\right)$

- A nozzle is a device which increases the velocity or KE of a fluid at the expense of its pressure drop, whereas a diffuser increases the pressure of a fluid at the expense of its KE.
- $\mathrm{Q}=0, \quad \mathrm{~W}=0, \quad \Delta \mathrm{PE}=0, \quad \mathrm{~m}_{1}=\mathrm{m}_{2}$
- ie, $\mathrm{m}\left(\mathrm{h}_{1}+\mathrm{Cl}^{2} / 2\right)=\mathrm{m}\left(\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2\right)$
- Compared to exit velocity, inlet velocity is negligible,

$$
\mathrm{h}_{1}=\left(\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2\right)
$$

- ie. $\mathrm{h}_{1}=\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2$
- or, $\mathrm{C}_{2}=\sqrt{ }\left\{2\left(\mathrm{~h}_{1}-\mathrm{h}_{2}\right)\right\} \mathrm{m} / \mathrm{s}$
- Where $h_{1}-h_{2}$ is in $J / k g$
- When a fluid flows through a constricted passage, like a partially opened valve, an orifice, or a porous plug, there is an appreciable drop in pressure, \& the flow is said to be throttled.
- $\mathrm{Q}=0, \quad \mathrm{~W}=0, \quad \Delta \mathrm{PE}=0, \quad \mathrm{~m}_{1}=\mathrm{m}_{2}$
- ie. $\left(\mathrm{h}_{1}+\mathrm{C}_{1}^{2} / 2\right)=\mathrm{m}\left(\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2\right)$
- ie. $\mathrm{h}_{1}+\mathrm{C}_{1}^{2} / 2=\mathrm{h}_{2}+\mathrm{C}_{2}^{2} / 2$

- Often the pipe velocities in throttling are so low that the KE terms are also negligible. $\Delta \mathrm{h}_{1}=\mathrm{h}_{2}$
- ie. Throttling process is a pressure drop at constant enthalpy unless otherwise mentioned.
- Assuming a throttle to be a constant enthalpy process leads us to define a property called the Joule-Thomson coefficient $\mu_{\mathrm{J}}$ as:

$$
\mu_{\mathrm{T}}=\left[\frac{\mathrm{OT}}{\mathrm{OF}}\right)_{\mathrm{h}}
$$

- Positive value for $\mu$ means that the fluid temperature drops during throttling process.
- Negative value for $\mu$ means that the fluid temperature raises during throttling process.
- Q. Steam enters a turbine at $20 \mathrm{~m} / \mathrm{s}$ \& at a specific enthalpy of $3000 \mathrm{~kJ} / \mathrm{kg}$ and leaves the turbine at $40 \mathrm{~m} / \mathrm{s}$ and at a specific enthalpy of $2500 \mathrm{~kJ} / \mathrm{kg}$. Heat lost to the surroundings is $25 \mathrm{~kJ} / \mathrm{kg}$. Steam passes through the turbine with a flow rate of $3,60,000 \mathrm{~kg} / \mathrm{hr}$. Determine the output from the turbine in MW.
- Ans.
- $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{g}_{1} \mathrm{z}_{1}\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{g}_{2} \mathrm{z}_{2}\right)$
- $\mathrm{C}_{1}=20 \mathrm{~m} / \mathrm{s}, \quad \mathrm{C}_{2}=40 \mathrm{~m} / \mathrm{s}, \quad \mathrm{Q}=-25 \mathrm{~kJ} / \mathrm{kg}$
- $\mathrm{h}_{1}=3000 \mathrm{~kJ} / \mathrm{kg}, \mathrm{h}_{2}=2500 \mathrm{~kJ} / \mathrm{kg}, \mathrm{m}=360000 / 3600=100 \mathrm{~kg} / \mathrm{s}, \mathrm{W} / \mathrm{s}=$ ?
- ie, $-25 \times 10^{3}+\left(3000 \times 10^{3}+20^{2}\right)=\mathrm{W}+\left(2500 \times 10^{3}+40^{2} / 2\right)$
- $\mathrm{W}=3000 \times 10^{3}+20^{2} / 2-25 \times 10^{3}-2500 \times 10^{3}-40^{2} / 2=474.4 \times 10^{3} \mathrm{~J} / \mathrm{kg}$
- Mass flow $/ \mathrm{sec}=360000 / 3600=100 \mathrm{~kg} / \mathrm{s}$
- $\mathrm{WD} / \mathrm{sec}=474.4 \times 10^{3} \times 100 \mathrm{~kW}=47.44 \mathrm{MW}$
- Q. A steam turbine receives steam at the rate of $22700 \mathrm{~kg} / \mathrm{hr}$ when it is delivering 500 kW power. The inlet $\&$ outlet velocities of steam are $75 \mathrm{~m} / \mathrm{s} \& 300 \mathrm{~m} / \mathrm{s}$ respectively. The inlet pipe is 3 m above the exhaust pipe. Neglecting the heat lost from the turbine, find the change in enthalpy per kg of steam.
- Ans.
- $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{g}_{1} \mathrm{z}_{1}\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{g}_{2} \mathrm{z}_{2}\right)$
- $\mathrm{C}_{1}=75 \mathrm{~m} / \mathrm{s}, \quad \mathrm{C}_{2}=300 \mathrm{~m} / \mathrm{s}, \quad \mathrm{W}=500 \mathrm{~kJ} / \mathrm{s}$
- $\mathrm{z}_{1}=3 \mathrm{~m}, \quad \mathrm{z}_{2}=0 \mathrm{~m}, \quad \mathrm{~m}=22700 / 3600=6.31 \mathrm{~kg} / \mathrm{s}, \quad \mathrm{Q}=0, \quad\left(\mathrm{~h}_{1}-\mathrm{h}_{2}\right)=$ ?
- $\left[\left(\mathrm{h}_{1}-\mathrm{h}_{2}\right)+\left(\mathrm{C}_{1}^{2}-\mathrm{C}_{2}^{2}\right) / 2+\left(\mathrm{z}_{1}-\mathrm{Z}_{2}\right) \mathrm{g}\right] \mathrm{m}-\mathrm{W}=0$
- Therefore,
- $\left[\left(\mathrm{h}_{1}-\mathrm{h}_{2}\right)+\left(75^{2}-300^{2}\right) / 2+(3-0) 9.8\right] 6.31-500 \times 10^{3}=0$
- ie, $\left[\left(\mathrm{h}_{1}-\mathrm{h}_{2}\right)-(42187.5)+29.4\right] 6.31=500 \times 10^{3}$
- $\mathrm{h}_{1}-\mathrm{h}_{2}=\left(500 \times 10^{3}\right) / 6.31+(4.2187 .5-29.4)=121.397 \mathrm{~kJ} / \mathrm{kg}$
- Q) A centrifugal air compressor used in gas turbine power plant receives air at $100 \mathrm{kPa} \& 300$ K. It discharges air at $400 \mathrm{kPa} \& 500 \mathrm{~K}$. The velocity of the air leaving the compressor is 100 $\mathrm{m} / \mathrm{s}$. Neglecting the velocity at the entry of the compressor, determine the power required to drive the compressor for a mass flow rate of $5 \mathrm{~kg} / \mathrm{s}$. Neglect any heat transfer. Take $\mathrm{C}_{\mathrm{P}}$ (air) $=1$ kJ/kg K.
- Ans.
- $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{gz}_{1}\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{gz}_{2}\right)$
- $\mathrm{P}_{1}=100 \mathrm{kPa}, \mathrm{P}_{2}=400 \mathrm{kPa}, \quad \mathrm{T}_{1}=300 \mathrm{~K}, \quad \mathrm{~T}_{2}=500 \mathrm{~K}, \quad \mathrm{~m}=5 \mathrm{~kg} / \mathrm{s}, \quad \mathrm{C}_{1}=0$
- $\mathrm{Cp}=1 \mathrm{~kJ} / \mathrm{kg} \mathrm{K}, \mathrm{W} / \mathrm{s}=$ ?
- ie, $\left[\left(\mathrm{h}_{1}-\mathrm{h}_{2}\right)+\left(\mathrm{C}_{1}{ }^{2}-\mathrm{C}_{2}{ }^{2}\right) / 2\right] \mathrm{m}=\mathrm{W}$
- But, $\Delta \mathrm{h}=\mathrm{Cp} \Delta \mathrm{T}$
- ie, $\left[\mathrm{CP}\left(\mathrm{T}_{1}-\mathrm{T}_{2}\right)+\left(\mathrm{C}_{1}{ }^{2}-\mathrm{C}_{2}{ }^{2}\right) / 2\right] \mathrm{m}=\mathrm{W}$
- $\left[1 \times 10^{3}(300-500)+\left(0^{2} 100^{2}\right) / 2\right] 5=\mathrm{W}$
- $\left(-200 \times 10^{3}-5000\right) 5=\mathrm{W}$
- ie, W/s = $1025000 \mathrm{~J} / \mathrm{s}$
- or Power $=-1025 \mathrm{~kW}$
- Q. Air flow steadily at the rate of $0.5 \mathrm{~kg} / \mathrm{s}$ through an air compressor, entering at $7 \mathrm{~m} / \mathrm{s}$ velocity, 100 kPa pressure, and $0.95 \mathrm{~m}^{3} / \mathrm{kg}$ volume, and leaving at $5 \mathrm{~m} / \mathrm{s}, 700 \mathrm{kPa} \& 0.19 \mathrm{~m}^{3} / \mathrm{kg}$. The internal energy of the air leaving is $90 \mathrm{~kJ} / \mathrm{kg}$ greater than that of air entering. Cooling water in the compressor jackets absorbs heat from the air at the rate of 58 kW .
- a) Compute the rate of shaft work input to the air in kW.
b) Find the ratio of the inlet pipe diameter to outlet pipe diameter.

## - Ans.

- $\mathrm{C}_{1}=7 \mathrm{~m} / \mathrm{s}, \quad \mathrm{C}_{2}=5 \mathrm{~m} / \mathrm{s}, \quad \mathrm{Q}=-58 \mathrm{~kW}, \quad \mathrm{P}_{1}=100 \mathrm{kPa}, \quad \mathrm{P}_{2}=700 \mathrm{kPa}$
- $\mathrm{V}_{1}=0.95 \mathrm{~m}^{3} / \mathrm{kg}, \quad \mathrm{V}_{2}=0.19 \mathrm{~m}^{3} / \mathrm{kg}, \mathrm{m}=0.5 \mathrm{~kg} / \mathrm{s}, \quad \mathrm{d}_{1} / \mathrm{d}_{2}=? \quad \mathrm{~W}=?$
- $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{~h}_{1}+\mathrm{C}_{1}^{2} / 2+\mathrm{gz}_{1}\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{C}_{2}^{2} / 2+\mathrm{gz}_{2}\right)$
- ie, $\mathrm{Q}+\mathrm{m}_{1}\left(\mathrm{u}_{1}+\mathrm{p}_{1} \mathrm{v}_{1}+\mathrm{c}_{1}^{2} / 2+\mathrm{gz} 1\right)=\mathrm{W}+\mathrm{m}_{2}\left(\mathrm{~h}_{2}+\mathrm{c}_{2}^{2} / 2+\mathrm{gz}_{2}\right)$
- $-58 \times 10^{3}+0.5\left[-90+\left(100 \times 10^{3} \times 0.95-700 \times 10^{3} \times 0.19\right)+\left(7^{2}-5^{2}\right) / 2\right]=\mathrm{W}$
- ie, $-58000+0.5\left[-90 \times 10^{3}-38000+12\right]=W$
- ie, $\mathrm{W}=-121.994 \mathrm{~kW}$
- From mass balance, $\mathrm{A}_{1} \mathrm{C}_{1} / \mathrm{V}_{1}=\mathrm{A}_{2} \mathrm{C}_{2} / \mathrm{V}_{2}$
- ie $\mathrm{A}_{1} / \mathrm{A}_{2}=\mathrm{C}_{2} / \mathrm{C}_{1} \times \mathrm{V}_{1} / \mathrm{V}_{2}=5 / 7 \times 0.95 / 0.19=3.57$
- $\mathrm{A}=\pi \mathrm{d}^{2} / 4$
- ie $\mathrm{d}_{1} / \mathrm{d}_{2}=\sqrt{ } 3.57=1.89$
- Following two cases only will be discussed : 1 . Filling a tank.
- 2. Emptying a tank or tank discharge.
- Filling a tank : Let
- m1 = Initial mass of fluid, p1 = Initial pressure, v1 = Initial specific volume, T1 = Initial temperature, u1 = Initial specific internal energy,
- m2 = Final mass of fluid, p2 = Final pressure,
